Foreword

The 2019 Kenya Population and Housing Census (KPHC) was conducted from the night of 24th/25th to 31st August 2019 and followed the United Nations Principles and Recommendations for conducting the 2020 round of censuses. The theme of the Census was “Counting Our People for Sustainable Development and Devolution of Services”. This resonated very well with Kenya’s development agenda - Vision 2030 and the Big Four, as well as other regional and international development initiatives such as the African Union Agenda 2063 and the Sustainable Development Goals (SDGs). The main objective was to provide the Government of Kenya and other stakeholders with essential information for evaluating policies and easing planning and budgeting processes.

The first set of the census basic reports (Volumes I-IV) were released in a record 6 months after enumeration. The second set of the census reports covers the thematic areas of: Fertility and Nuptiality; Mortality; Migration; Education and Training; Youth and Adolescents; Information and Communication Technology; Housing Conditions, Amenities and Household Assets; Gender Dimensions; Older and Vulnerable Population; Urbanization; Disability; Household and Family Dynamics; Labour Force Dynamics; Agriculture; Population Dynamics; and Population Projections.

This monograph presents information on population projections based on the 2019 Kenya Census data for a period of twenty-five years, from 2020 to 2045. The projected population is expected to increase from 48.8 million in 2020, to 53.3 million by 2025, then to 57.8 million by 2030, then to 62.2 million by 2035, and eventually reach 70.2 million by 2045.

The information provides valuable programmatic evidence to policymakers for use in the formulation of policies and plans explicitly intended to achieve SDG targets. The report not only adds knowledge but also serves as a foundation for assessment, reporting and eventually monitoring achievement of SDGs by 2030, Vision 2030, formulation of the Fourth Medium-Term Plan (MTP IV), County Integrated Development Plans (CIDPs), and other sector-specific plans.

On behalf of the Government of Kenya, I wish to thank the staff, management and Board of Directors of the Kenya National Bureau of Statistics, as well as the authors for their contribution towards the preparation of this report. I further wish to extend special thanks to our development partners, especially UNFPA, UNICEF, UN-Women, WHO and UNDP under the coordination of the UN Resident Coordinators’ Office, and all the other stakeholders who were involved in the process for their technical and financial support.

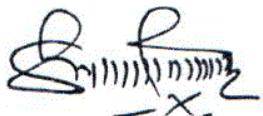

HON. (AMB.) UKUR YATANI, EGH
CABINET SECRETARY
THE NATIONAL TREASURY AND PLANNING

Acknowledgement

The 2019 Kenya Population and Housing Census (KPHC) was implemented under the provisions of the Constitution of Kenya, 2010 and the Statistics Act, 2006. The census was the sixth to be conducted in Kenya since independence and the first that was fully digitized, where the latest technology was embraced. This monograph is among the set of 16 such reports, addressing various topical areas regarding the demographic, social, and economic profiles of the Kenyan population.

The 2019 KPHC implementation process was accomplished through a concerted effort of various government ministries, departments, agencies, international and local organizations and individuals who assisted during the preparation, collection, compilation, processing, analyzing and publishing the results. The Kenya National Bureau of Statistics (KNBS), on behalf of the Government of Kenya, takes this opportunity to sincerely thank all those who participated in the preparation of this report.

The Bureau is indebted to all the organs of government, the private sector, and the general public for the overwhelming support and participation in the successfully implemented 2019 Census. Special gratitude goes to the United Nations Population Fund (UNFPA); United Nations Entity for Gender Equality and the Empowerment of Women (UN-Women); United Nations Children's Fund (UNICEF); United Nations Economic Commission for Africa (UNECA); World Health Organization (WHO); United Nations Development Programme (UNDP) under the coordination of the UN Resident Coordinators' Office (UNRCO); African Development Bank (AfDB); Statistics Sweden; Office of National Statistics, United Kingdom (ONS-UK); and Italian Agency for Development Cooperation (AICS) for their immense support. I also recognize the census personnel (coordinators, content and ICT supervisors, enumerators, village elders and security) for the role they played in the overall success of the 2019 KPHC.

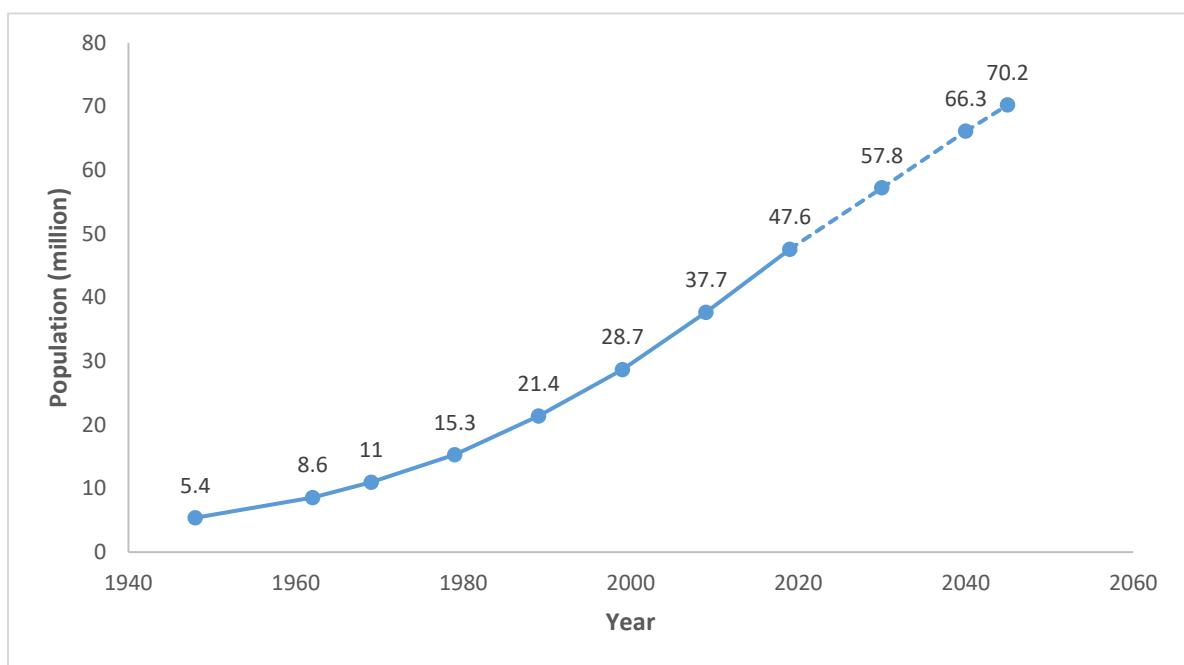

**MACDONALD G. OBUDHO, MBS
DIRECTOR GENERAL
KENYA NATIONAL BUREAU OF STATISTICS**

Kenya's Population Growth, 1948-2045

Executive Summary

This report presents population projections for Kenya and for the 47 counties, based on the 2019 Kenya Population and Housing Census data. The projections are based on different assumptions about the future trends in fertility, mortality, international and internal migration. The annual projected population figures are given from 2020 through 2045.

Chapter 1 presents the general introduction providing the census background, objectives, uses of population projections, census data collection methodology, assessment of data quality, and definitions of key concepts and terms. Information on age and sex is very key in population projections. Generally, there was improved age reporting but wide differentials by place of residence and county. In some of the ASAL Counties, there was a suspected over-reporting of male births as opposed to females, giving high sex ratios at birth. In addition, deaths in the age group 5-65 that occurred in the households before the census were under-reported and this was more severe for female deaths. Coverage of male deaths was just about 61 percent while for female deaths it was about 39 percent for this age group. When the age range was narrowed from 30 to 60, coverage for male deaths was slightly lower at 59 percent while it remained the same for female deaths.

Chapter 2 documents shows the general methodology employed in projecting the population including the assumptions used in the three components of population change; fertility, mortality and migration. The cohort component method was used to project both the national and county populations. The method was based upon the balance equation extended for sex and age.

At the national level, projections used four historical estimates of fertility generated from the 1989, 1999, 2009 and 2019 censuses as inputs. PASEX TFR_ProjLogistic application was used to project Total Fertility Rate (TFR) values to 2045 based on fitting of a logistic function to TFR values. The method assumed that the TFR would continue to decline over the projection period. A similar approach was used to interpolate and extrapolate fertility rates at the county level.

On mortality, life tables were developed to establish the set-up of initial level and composition of mortality by males and females. Expectation of life at birth (e_0) was used to compute the person-years lived between exact ages x and $x+n$ (nL_x) for the different projection cycles. The application PASEX EOLGST was used to generate values of expectation of life at birth for both males and females. The projection was done using a logistic function with a lower asymptote of 30 years for both males and females, and an upper asymptote of 70 years for males and 75 years for females. These estimates were considered in part that mortality has declined in Kenya in the past decade.

Regarding migration, Kenya continues to record very low volumes of international migration (less than 1%) – hence an insignificant factor in population change, and therefore not incorporated into the national

population projections. At county level, the number of in-migrants and out-migrants 12 months prior to the census night was tabulated by age and sex. Recent average net migration rates were computed and subsequently used in the population projection exercise. Extrapolation was done to move the data from 1 year to 5 years.

Chapter 3 outlines the results of the population projections at the national and county levels. At the national level, population is expected to increase from 48.4 million in 2020 to 52.9 million in 2025, to 57.6 million in 2030, to 62.4 million in 2035, to 67.1 million in 2040, and to 70.2 million in 2045. At the county level, population is expected to continue growing at varying rates and that none of the counties is expected to experience a population decline at any point within the projection period. Counties expected to experience the highest percentage of population increase during the projection period are Kajiado (87%), Lamu (86%), Samburu (80%), Narok (78%), Tana River, Kiambu and Mombasa at 77 percent each.

In terms of numbers, Nairobi City, Kiambu, Nakuru, Kajiado and Mombasa will have the highest increases. Counties to experience the lowest population increases are Makueni (5%), Vihiga (6%), Kisii (11%), Kitui (13%), and Murang'a (20%). This may be explained largely from the fact that these counties were net losers in terms of migrants.

Chapter 4 presents the sectoral population projection results which include school-age population, labour force and household projections. Nationally, children of pre-school age 4-5 years are expected to increase by 2.8 percent over the next ten years. Those of primary school age 6-11 years under competency-based curriculum (CBC) are expected to increase by 4.4 percent; and those of lower secondary school age 12-14 under CBC are expected to increase by 6.5 percent. Pupils of senior secondary school age 15-17, under CBC are expected to increase by 8.4 percent over the next 10 years.

Nationally, the population in the labour force is expected to increase by 40.7 percent - from 28.8 million in 2020 to 40.5 million by 2035.

Results of household projections indicate that by 2030, there will be approximately 15.9 million households. Nairobi, which is entirely urban, will require nearly 2 million houses to host its population of 5 million by 2030.

Chapter 5 provides a summary, conclusion, and recommendations. The following are the key recommendations:

- That the following critical aspects be addressed at different stages of census management: design of questionnaire (maintain the bare minimal number of questions); publicity (reiterate the various data quality issues, especially those associated to specific regions); training (maximize this forum to improve data quality); field coordination (for quality assurance).

- That the census questionnaire should clearly capture data on rural-urban migration in the future to enable projection of this category of population.
- That regular review of the population projections be undertaken once new data on any of the three components of population change (fertility, mortality and migration) becomes available.

Chapter 1: Introduction

1.1. Background Information

A population census is a total process of collecting, compiling, evaluating, analysing, and publishing or disseminating demographic, economic, and social data pertaining, at a specified time, to all persons in a country or a well-delimited part of a country. It is vital for effective national development planning because it provides detailed benchmark data on all population characteristics.

The first known population census in Kenya was conducted in 1897 and was a headcount. This was followed by the 1948 census that focused on non-natives. A complete census that enumerated 8.6 million persons was conducted in 1962 and was used to set up political and administrative structures. The first post-independence census was undertaken in 1969 and enumerated 10.9 million persons. Since then, the country has conducted decennial Population and Housing Censuses on a de facto basis with the midnight of 24th/25th August as the reference point. The censuses have been implemented in accordance with the UN Principles and Recommendations for conducting population and housing censuses. Table 1.1 presents trends in census counts since 1897.

Table 1.1: Summary of Census Counts in Kenya, 1897-2019

Year	Population (millions)
1897	2.5
1948	5.4
1962	8.6
1969	10.9
1979	15.3
1989	21.4
1999	28.5
2009	37.7
2019	47.6

The 2019 Kenya Population and Housing Census was conducted under the provisions of the Constitution of Kenya, 2010 (Fourth Schedule Part 1, Item 11), Statistics Act of 2006 (Revised Edition 2019) and the Statistics (Census of Population) Order, 2018 - Legal Notice No. 205 and the Cabinet Memorandum of May 2017 on the implementation of the 2019 population and housing census process. The theme for the census was "**Counting Our People for Sustainable Development and Devolution of Services**".

1.2. Objectives of the 2019 Census

The main objective of the 2019 KPHC was to collect information on the size, composition, distribution, and socio-economic characteristics of the population. The specific objectives were to ascertain the:

- Population size, composition, and spatial distribution;
- Levels of fertility, mortality, and migration;
- Educational attainment;
- Household composition;
- Rate and pattern of urbanization;
- Size and deployment of labour force;
- Distribution of persons with disability;
- Housing conditions and availability of household amenities; and
- Agricultural indicators to inform the creation of an agriculture sampling frame.

This information will be used in: planning, budgeting, and programming for important services; future policy formulation, and resource allocation; creation of administrative and political units; monitoring and evaluation of programmes and projects; research; development of a master household sampling frame; development of a geospatial database; and benchmarking for agricultural censuses and surveys.

1.3. Uses of Population Projections

The primary needs of the Kenyan people, which all development programmes aim to satisfy, cannot be gauged rationally without regard to the expected size, composition and distribution of the population at different geographic units and points in time.

There are five distinct areas in which population projections are a necessary input:

1. **Distribution of resources** - planning is the most obvious and frequent use of population projections. National and county planners all need, for various purposes, to have some idea of likely future changes in size, composition and distribution of the population in their respective areas. Demand for projected population at the county level is currently greater than never before. Planners at this level need to have an idea of the likely future size, composition and distribution of the population in their respective administrative areas for the design of policies, allocation of resources and provision of various services including transportation, health, education, among others.

2. **Advocacy** – especially where there is a negative impact of a particular phenomenon on population or vice versa. This includes, for instance, the policies to harness a demographic dividend, and the need to develop effective policies that foster education and economic opportunities for the growing number of women and young people, or the need to adapt social sector spending to the changing age structure and providing social support and health care for the elderly population.
3. **Research** - Researchers frequently use projections to try to answer questions that relate to future economic and social development. They may study, for instance, the future growth of the working age population and the challenges for generating sustainable employment and livelihood opportunities in both urban and rural areas of Kenya.

However, population change can equally be regarded as being, to some extent, a dependent rather than independent variable in the planning process. As such, population projections would be used to estimate the likely impact of policy changes and planning decisions on demographic trends. This includes, for instance, the estimation of the impact of improved family planning and health services on fertility and mortality rates at the national and county levels.
4. **Monitoring and evaluation** - population projections become an important input for programmes not only during target setting, but also for monitoring and evaluation, especially at impact level. They are useful in assessing whether Kenya is on track in achieving national and international development targets such as the SDGs to which it has committed itself to achieving. Most of programme indicators in monitoring progress need population figures as denominators.
5. **Private sector** – population projections are a critical input in driving production and consumption.

1.4. Census Data Collection Methodology

1.4.1. Use of Technology

Kenya adopted the use of mobile technology to collect data during the 2019 Census as recommended by the UN for the 2020 round of censuses. This was the first census in Kenya's history to use mobile technology in the capture and transmission of data for both cartographic mapping and enumeration. During mapping, the Geographic Positioning System (GPS) coordinates for homesteads, households and other points of interest within the locality were collected using the mobile devices with an accuracy of plus or minus 5 meters. The enumeration area (EA) maps were developed using Arc GIS software on a background of aerial photographs and satellite imageries that were not more than six months old from the date of the field cartographic data collection. The EA maps were then uploaded into the tablets assembled by two local universities to facilitate the 2019 Census enumeration exercise.

1.4.2. Recruitment and Training

Recruitment of census personnel, who included content supervisors, supervisors and enumerators was undertaken by the County and Sub-County Census Committees through a competitive process. The training of these personnel was conducted in a cascaded manner from the training of trainers to the training of enumerators. The training for various cadres was conducted for seven days for each cadre. These trainings were sequentially conducted between 14th July and 20th August 2019.

1.4.3. Enumeration

The census enumeration was preceded by enumeration area (EA) boundary identification and pre-enumeration listing of households in each EA for two days prior to the census night. The pre-enumeration household listing exercise helped in gauging the expected workload during the seven days of enumeration and also in monitoring the level of coverage as enumeration progressed.

The actual enumeration took place from the night of 24th/25th August 2019 and ended on 31st August 2019. A mop-up exercise was conducted on 1st and 2nd September 2019. Special populations were strictly enumerated on the night of 24th/25th August 2019. The 2019 Census adopted the de facto approach where all persons within the boundaries of Kenya were enumerated depending on where they spent (or were found on) the census night. The canvasser method of enumeration, where information for each household or individual is collected and recorded by a trained census official designated to perform the tasks in the assigned area, was used.

1.4.4. Data Transmission and Storage

Data collected by enumerators using mobile devices (tablets) were subsequently transmitted to a central server. The data were encrypted prior to transmission and backed up in off-site locations.

1.4.5. Data Processing

Editing of the census data was guided by the United Nations Handbook on Population and Housing Census Editing (Revision 2, 2019). The data were processed using the Census and Survey Processing System (CSPro), Stata and SPSS softwares. In addition, validation checks were done to ensure that all EAs, aligned to administrative boundaries, were accounted for in the dataset. Outputs were generated based on administrative and geo-political units

1.4.6. Quality Assurance

Quality assurance was integrated in all phases of the census process. Comprehensive guidelines were developed and shared with census personnel. Field supervision followed a three-tier structure to ensure

adequate support, real-time response to emerging issues, and feedback during data collection. In addition, enumeration reporting schedules and control forms were used to facilitate the monitoring of activities. Field monitoring teams oversaw technical, logistical, and administrative aspects of enumeration in each county. Further, independent observers, drawn from the international community and National Statistics Offices (NSOs) across Africa, monitored and observed the 2019 census enumeration process.

1.5. Census Data Quality

Evaluation of data is one of the steps in the census process for quality assurance. Evaluation techniques are often necessary to determine whether the data collection was correctly done and whether the data are of acceptable quality. A census, being a massive data collection exercise involving thousands of field interviewers, errors may creep in at any stage of data collection and processing.

An evaluation of census data is desirable to assess the quality of the data. Evaluative studies probe into the qualitative and the quantitative aspects of the data. Errors fall into two broad headings: coverage and content errors. Coverage errors arise due to omissions or duplications of persons or housing units in the census enumeration. Content errors arise from incorrect reporting or recording of the characteristics of persons, households, and housing units enumerated in the census. According to the United Nations, good census practice requires careful consideration and an evaluation of the completeness and accuracy of census results.

1.5.1. Coverage errors

There are two types of coverage errors: population under-coverage refers to the error of excluding someone who should have been enumerated; while population over-coverage refers to the error of either enumerating someone more than once or including someone who should not have been enumerated. Under-coverage is more common than over-coverage hence the latter error is considered negligible.

Coverage errors are one of the most important types of error since they affect not only the accuracy of the counts of the various census universes, but also the accuracy of all of the census data describing the characteristics of these universes.

Coverage errors may occur in various forms, namely: omitting a unit that should have been included; including a unit more than once; or including a unit that should not have been included. In spite of the fact that massive efforts are made in providing good training and up-to-date cartographic maps to the field staff, as well as introducing checks and controls throughout the fieldwork, such errors still occur. Consequently, any census data should always be checked for any inconsistencies as a result of such errors. Various techniques have been developed for checking for such inconsistencies including Post-census Enumeration Survey (PES). However, in the 2019 KPHC, Kenya did not conduct PES; but instead opted to use other demographic techniques to correct such errors.

1.5.2. Content errors

These types of errors occur when an attribute of an enumerated individual is misreported or not reported at all. One common content error occurs in the reporting of age of an individual which is one of the basic but very vital attribute provided by a census of a population

Population data in developing countries are often subject to age misreporting. Irregularities in the age distribution may be a result of a respondent's incorrect age declaration or the interviewer who estimates the age of a respondent who does not know his or her age. It is, therefore, important to evaluate the accuracy of the age distribution and correct for deficiencies wherever necessary.

1.5.3. Comparison of 2019 Census and Previous Censuses

This section compares the enumerated population at the 2019 census with the past censuses in terms of absolute size as well as intercensal growth rates. The method is referred to as an external consistency check.

Table 1.2 presents population distribution by age in absolute numbers since 1979. The number of persons enumerated during the 2019 Population and Housing Census was 47,564,299 representing an increase of 26.1 percent from the 2009 census.

Table 1.2: Trends in Enumerated Population by age group, 1979-2019

Age	1979	1989	1999	2009	2019
0-4	2,843,406	3,801,066	4,353,530	5,803,130	5,993,267
5-9	2,491,840	3,470,201	3,952,376	5,469,372	6,202,643
10-14	2,074,771	2,990,730	4,009,455	4,919,417	6,346,072
15-19	1,741,845	2,379,439	3,417,064	4,073,944	5,285,857
20-24	1,327,404	1,903,130	2,852,320	3,688,548	4,447,674
25-29	1,055,712	1,629,771	2,351,866	3,127,829	3,854,555
30-34	818,076	1,159,526	1,705,604	2,461,739	3,570,719
35-39	615,594	918,923	1,435,730	1,962,578	2,650,116

Total	15,327,061	21,443,636	28,485,869	37,724,850	47,564,299

Table 1.3 shows the trend in intercensal age-specific growth rates between 1979 and 2019. The rate of growth declined from 3.4 percent in the 1979-89 intercensal period to about 2.8 percent in the 1989-99 period. The rate of growth, however, remained unchanged during the 1999-2009 period, which was against

the expectation that the rate would decline faster given the observed declines in both birth and death rates from the various surveys conducted in the intercensal period. During the 2009-2019 intercensal period, the growth rate declined from 2.8 percent to 2.3 percent.

Inspection of the age-specific growth rates in the 2009-2019 intercensal period revealed an indication of a slight undercount for age groups 0-4 and 5-9. This observation is similar to the period 1989-1999.

Table 1.3: Age specific growth rates, Kenya, 1979-2019

1.5.4. Age-Sex Structure

The age-sex data is a map of a population's demographic history. Persons of the same age structure constitute a cohort born in the same year and have been exposed to similar historical events and conditions.

Age- Sex Ratio

Although all modern censuses collect information on the age and sex of the population, the data often contain errors because some people do not know their true age while others do not report their age accurately. The distribution of a population by age and sex is one of the most basic types of information needed for future planning. Given the importance of the age structure concerning social and economic characteristics, it is imperative that the information on the population by age and sex be as accurate as possible. For this reason, it becomes critical to evaluate the reported age and sex composition.

Sex Ratio at Birth

Sex ratios at birth (SRB) are an analytical tool and are calculated by dividing the male population in a given age group by the female population in the same age group, multiplied by 100. The larger the abrupt departure of this ratio from values close to 100, the larger the possibility of errors in the data. All populations have more males than females at birth, and so the sex ratio at the early ages is expected to be slightly over 100. However, since mortality is usually higher for males than females, the sex ratio declines continuously up to the oldest ages. Sex ratios at infancy below 100 denote under-coverage while those above 100 would imply double counting.

In a systematic study of several countries using DHS data, Chao et al. (2019¹) show that SRB range from 103.1 [102.7; 103.6] in sub-Saharan Africa to 106.3 [105.5; 107.2] in south-eastern Asia; 106.3 [105.4; 107.2] in eastern Asia, and 106.7 [105.8; 107.7] in Oceania. The UN assumes 105 for all countries in their estimation. Thus, there is a regularity in male bias at birth. Over decades, SRB has consistently been between 102 and 108 males per 100 females for several decades. In Kenya, all the post-colonial censuses (1969-2009), show that at the national level, SRB has been constant at 104 males per 100 females.

Table 1.4 shows the sex ratios at birth for all the counties based on births 12 months before the national census. Thirty seven counties (out of 47) had their sex ratios at birth consistent with past historical norms (between 102 and 107). In Isiolo, Tana River, Wajir, Turkana and Samburu counties, there appears to be a possible over-reporting of male births. Their sex ratios at birth were close to those observed in South East Asian countries with well-known sex-selective abortion. Under-reporting of male births may have occurred in Vihiga County.

¹ Chao Fengqing Patrick Gerlandb, Alex R. Cookc, and Leontine Alkema. 2019. Systematic assessment of the sex ratio at birth for all countries and estimation of national imbalances and regional reference levels

Table 1.4: Sex ratios at birth by County, 2019

County	Sex ratio at birth	County	Sex ratio at birth
1 Vihiga	99.7	25 Makueni	103.6
2 Kakamega	100.8	26 Mombasa	103.8
3 Busia	100.9	27 Kilifi	103.8
4 Bungoma	101.4	28 Migori	103.9
5 Tharaka-Nithi	101.6	29 West Pokot	104.0
6 Nyamira	102.1	30 Nakuru	104.0
7 Trans-Nzoia	102.2	31 Homabay	104.1
8 Uasin Gishu	102.4	32 Kwale	104.3
9 Nyeri	102.5	33 Kajiado	104.3
10 Kiambu	102.5	34 Kericho	104.3
11 Meru	102.6	35 Laikipia	104.5
12 Nandi	102.6	36 Bomet	104.5
13 Nairobi City	102.6	37 Mandera	105.0
14 Kirinyaga	102.7	38 Narok	105.9
15 Embu	102.8	39 Lamu	106.3
16 Elgeyo-Marakwet	102.8	40 Baringo	106.6
17 Kisii	102.8	41 Garissa	107.0
18 Taita-Taveta	102.9	42 Marsabit	107.0
19 Siaya	103.0	43 Isiolo	108.0
20 Kitui	103.1	44 Tana River	108.8
21 Murang'a	103.1	45 Wajir	109.0
22 Kisumu	103.1	46 Turkana	109.0
23 Machakos	103.3	47 Samburu	109.0
24 Nyandarua	103.5		

Tables 1.5 and 1.6 show sex ratios at older ages (age 60 and above). Worldwide, women live longer than men hence at ages beyond 60, particularly in developing countries like Kenya with higher adult mortality, sex ratios should be below 100 unless there is selective out-migration of women at those ages. In Wajir, Mandera, and Garissa, there was an indication that population of men above age 60 were over-reported. The sex ratios for ages above 60 years for Mandera, Wajir Garissa have not changed, an indication of a possible over-count of population at these ages.

Table 1.5: Highest and lowest sex ratios of the population age 60 and above, 2009

1.5.5. Completeness of Birth Reporting

This analysis was done using the Brass P/F ratio approach. This technique evaluates the consistency between information on lifetime fertility and current fertility. The P/F ratio for the combined age group 20–29 years is used as an adjustment factor to compensate for the completeness of recent birth recording. A trend of rapidly increasing P/F ratios with age probably reflects strong effects of declining fertility. Where fertility is falling over time, average parity, which is based on women's lifetime experiences, will exceed cumulated current fertility, assuming complete recording of recent births. Consequently, the P/F ratios will be greater than one. They will also tend to increase with age since lifetime fertility among younger women has occurred more recently and will differ little from cumulated current fertility of constant fertility over an extended period. The results for the application of the P/F ratios for the 2009 and 2019 censuses are presented in Table 1.7 below. The adjusted number of births would be 1,356,533 against the reported 1,241,546. It therefore, suggests that overall, births may have been under-reported by approximately 8.5 % and compares with the earlier detection using sex ratio and birth and age-specific growth rates.

Table 1.7: Adjusted age-specific birth rates, 2019

Age group	Final Fertility						
	Female Population	Intercensal	P/F Ratios	Adjusted	adjusted		
	Initial 2009	Annual Births	(2 Censuses)	Births(2)	birth rate

Total	9,394,131	12,014,728	3.82	1,292,550		1,356,533	3.5

1.5.6. Quality of Reported Deaths, 2019

A simple measure for interrogating data quality by age is to examine the ratio of deaths age 60+ to age 75+ and age 75+ to age 90+. At the national level, these ratios were 0.5 and 0.3 respectively, indicating substantial age exaggeration at older ages.

A comparison of distribution of reported deaths by age and sex between 2009 and 2019 censuses is shown in Table 1.8 below. The share of those under age one and age 1 to 4 declined substantially for both sexes. The share of those age 65 and above increased substantially for both sexes. The least shares in 2009 were for age 15-19 for males 10 to 14 for females. In 2009, the proportion of deaths under age one was 68.7 percent for males and 65 percent for females to the total births under age 5. In 2019, this share increased to 82 percent and 80 percent for males and females respectively. This increase could be a reflection of problems with reporting of age of infants.

Table 1.8: Distribution of Reported Deaths by Age and Sex, 2009 & 2019

Residence/ Age Groups	2009		2019	
	Males	Females	Males	Females

More information on the 2019 KPHC mortality data is provided in the Mortality Analytical Report.

1.5.7. Summary of Data Quality Issues

The summary of data quality issues noted from the 2019 KPHC were:

- That there was a possible under-coverage of births in the last 12 months before the census, by as much as 8.5 percent. In Marsabit, there was a suspected over-reporting of male births as opposed to female, giving a high sex ratio at birth similar to countries where sex-selective abortions occur. In Mandera, there was a possible under-reporting of female births;
- That deaths in age 5-65 that occurred in the households before the census were under-reported and this was more severe for females. Coverage of male deaths was just about 61 percent while that for females was about 39 percent. When the age range was narrowed from 30 to 60, coverage for male deaths was slightly lower at 59 percent while that for females remained the same.
- That there was improved age reporting but with wide differentials by place of residence and county. There was better reporting of age in rural areas compared to urban areas according to the UN accuracy index. Garissa, Wajir, Mandera, Isiolo, and Marsabit counties had the lowest accuracy on age reporting. In these counties, males age 60 and above were over-reported.

1.6. Definitions of Key Concepts and Terms

Age misreporting: This is where a person states his/her age wrongly by giving a value which is less or higher than actual, either intentionally or unintentionally.

Age ratio: It is the proportion of population in a given age group to its adjacent age groups, that is the successive and the predeceasing age groups.

Age-sex accuracy index: It is an index that combines both the sex ratio and the age ratio for both males and females to generate a joint score.

Base population: It is the starting population on which population projections are based.

Content errors: These are errors in the characteristics of persons counted, resulting from incorrect reporting or recording or from failure to report.

Coverage errors: These are non-sampling errors that result from omitting a unit that should have been included, including a unit more than once, or including a unit that should not have been included.

De-facto: This is the collection of basic social, demographic and economic data for all people who would have spent a specified night in a given area. It is like taking a snapshot of the people in the area on that census night. Practically, the enumeration of people is done at household level or institution level (like a

dormitory in a school, a ward in a hospital, a cell in a prison, etc.). At this level, a de-facto census involves counting people who would have spent a specified night in a household or an institution. Special categories of people like those who would have spent the night fishing or working as watchmen are assumed to have spent the specified night in their respective usual households.

De jure: This is the collection of basic social, demographic and economic data for all the people who usually reside in the country. It would exclude visitors from other countries and include residents who would be outside the country at the time of enumeration. At household or institution level, the de jure census includes only usual members. The problem with a de jure census is to define the "*usual member*" of a household or an institution. A common definition of a "usual member" of a household as used in the Kenyan sample surveys and censuses is "a person who has continuously stayed in the household for six or more months, during the last 12 months".

Enumerated population: Refers to the total population as it was enumerated on the census night. Usually, census basic reports are generated based on the enumerated population.

Adjusted population: This is the resulting population after cleaning the enumerated population. An adjusted population can be higher or lower than the enumerated population depending on the margin of under-count or over-count. Census analytical reports are generated based on the adjusted population.

Household: Is a person or a group of persons who reside in the same homestead or compound but not necessarily in the same dwelling unit. They have the same cooking arrangements and are answerable to the same household head. For purposes of the 2019 KPHC, households were categorized into conventional and non-conventional. Conventional were the ordinary households while non-conventional households referred to people live together but cannot be said to belong to "ordinary" households. Examples were students in boarding schools and colleges, hospital in-patients, people in police cells, guests in hotels, prison inmates, outdoor sleepers, nuns, brothers in a monastery, and other religious organizations with some institution-like living arrangements.

Life expectancy: It is an estimate of the average number of additional years a person could expect to live if the age-specific death rates for a given year prevailed for the rest of his/her life. This can be derived for either males or females, and in most populations, it is slightly higher for females. It is commonly referred to as life expectancy at birth, denoted by $e(0)$ and it can be derived at any other age based on the current death rates.

Migration: This is the movement of people across a defined geographical boundary involving change of usual residence (UN DESA, 1998). Usual residence is the place at which the person has lived continuously for most of the last 12 months (that is, for at least six months and one day) or for at least the last 12 months, not including temporary absences for holidays or work assignments, or intends to live for at least six

months. The 2019 KPHC captured data which was used to measure internal and international migration. Internal migration occurs within the boundaries of a given country while international migration occurs across national borders.

Migration can occur in two directions:

In-migration: movement of persons into a region or an area;

Out-migration: movement of persons out of a region or an area;

Net migration is the difference between those who move in (in-migrants) and those who move out (out-migrants) of an area.

Population projection: It is an estimate of future population by considering changes in a population due to fertility (births), mortality (deaths) and migration.

Population pyramid: A diagram showing the comparison of a human population by sex and age at a given time, consisting of a pair of histograms, one for each sex, laid horizontally in ascending order of age groups with a common base. The diagram is intended to provide a quick overall comparison of the age and sex structure of the population.

Sex ratio at birth: The number of males per 100 females at birth.

Smoothed population: It is the population that has been adjusted for errors on age due to misreporting to give a more fitting demographic pattern.

Total fertility rate: It is the average number of children born alive to a woman during her lifetime if she were to bear children at each age in accordance with the prevailing age-specific fertility rates. It is obtained by summing up all age-specific fertility rates for each year of the childbearing span.

Chapter 2: Projections methodology

2.1. Introduction

The 2019 Kenya population projections used the cohort component method. This method is by far the most popular population projection method. It was used for national and county population projections. The cohort-component method is based upon the balance equation extended for age and sex and is, therefore, internally consistent. Because it is based on age-structured populations and events (births, deaths, migration), it yields a rich set of demographic indicators.

In this method, the components of population change (fertility, mortality, and net migration) are projected separately for each birth cohort. The method entails following each cohort of people of the same age throughout its lifetime according to its exposure to mortality, fertility, and migration. Starting with a base population by age and sex, the population at each specific age is exposed to the chances of dying as determined by projected mortality levels and patterns by age and sex. Once the deaths are estimated, they are subtracted from the surviving population, and those remaining alive become older. Fertility rates are projected and applied to the female population in childbearing ages to estimate the number of births every year. Each cohort of children born is also followed through time by exposing it to the appropriate mortality rates. Finally, the component method takes into account net-migrants who are incorporated at each specific age. The whole procedure is repeated for each year of the projection period, resulting in the projected population by age and sex for each year.

With the requisite input information about the components of population change available, the cohort component method was used to project both the national and county populations.

Assumptions about future fertility, mortality, and net migration that drive population projections were based on analysis of historical demographic trends for Kenya with regard to these components of population change, which were then used to project the population into the future. Note that projecting HIV prevalence, which is then incorporated into the projections, involves a separate methodology.

2.2. Methodology

The projections were generated using a top-down, net migration rates approach that begins with a national projection and produces county projections consistent with the national projection. It involves three steps:

The first step is to produce a national projection based on the stipulated national fertility and mortality parameters;

The second step is to produce county projections based on the stipulated county fertility, mortality, and migration parameters. Projected numbers of survivors of persons in each county are calculated in the same way as projected national numbers. Net numbers of age-sex-specific internal migrants for each county area

were calculated using net migration “rates”, the quotes signaling that these parameters are not demographic rates in the usual sense of the word (Feeney; 2017 - section 4).

In the nature of the situation, the county projections would not be perfectly consistent with the national projections - even if all county areas are closed to migration. The sum of the projected age-sex distributions for the county populations, for example, will not be equal to the projected national age-sex distributions. The same is true of projected components of growth, births, deaths, and net internal migrants. For internal migrants, inconsistency manifests as numbers of net migrants for county areas that do not sum to zero;

The third step is to adjust the county projections to make them consistent with the national projection. A side effect of this adjustment is a set of parameters that provide information on the degree of consistency between the stipulated national and county fertility, mortality, and migration parameters. Perfect consistency of the fertility and mortality parameters will result in adjustment parameters identically equal to 1. Perfect consistency of the county migration parameters will result in adjustment parameters identically equal to 0. The level of inconsistency is accordingly indicated by the extent to which the fertility, mortality, and internal migration adjustment parameters differ from 1 (fertility and mortality) or zero (internal migration).

2.2.1. Component Projections

Component projection for a national population closed to migration begins by projecting an initial distribution of population by age and sex in n year age groups forward n years to give a projected age-sex distribution, n denoting the width of the closed age groups. This process is repeated beginning with the 1st projected age-sex distribution to give a 2nd projected age-sex distribution, and so on for as many projection cycles as desired.

Each projection cycle corresponds to an n-year time period. The initial and projected age-sex distributions refer, respectively, to the beginning and end of this period. The fertility and mortality parameters and numbers of births and deaths refer to this time period. The values of the fertility and mortality parameters may of course change from one projection cycle to the next.

Projections are generally carried out for age distributions in single years ($n = 1$) or $n = 5$ -year age groups. The value of n dictates the future times for which projected age-sex distributions are provided. Single year age groups give projected age-sex distributions at single year time intervals. Five-year age groups result in projections at 5 year intervals.

The quality of the age distributions which reflects age-selective omission as well as age misreporting (United Nations Statistics Division, 2001), dictates calculations using 5-year age groups and so gives projected age distributions at 5-year intervals. Five year age-sex distributions at single year time intervals

may be interpolated. Interpolation to single year age distributions is possible, but is problematic and beyond the scope of this report.

Detailed methodology is provided in Appendix 2.

2.2.2. Fertility Assumptions

National projections used four historical estimates of fertility generated from the 1989, 1999, 2009 and 2019 censuses as inputs. PASEX TFR_ProjLogistic was used to project TFR values to 2045 based on fitting of a logistic function to TFR values. The method assumed that the TFR would continue to decline over the projection period. The lower asymptote was fixed at 2.1 (fertility replacement level) while the upper asymptote was 8.0 (the highest ever recorded fertility in the country). Table 2.1 shows the interpolation and extrapolation of the TFR values based on the logistic function. The results indicate that the TFR would decline from 3.1 in 2020 to 2.3 by 2045.

A similar approach was used to interpolate and extrapolate fertility at the county level. However, fertility in-put values varied from county to county. ASAL counties have had higher fertility compared to the rest of the counties in the country (KNBS - Analytical Report on Fertility and Nuptiality, 2022). Such counties would take a longer period to reach fertility replacement level.

Table 2. 1: Projected Total Fertility Rate Using the Logistic Function

	A	B	C	D	E	F
4	Item / date	Input values	Output values			
5			Date	TFR	Date	TFR
6	Asymptotes:		2020	3.11	2020	3.11
7	Lower	2.10	2021	3.05	2025	2.84

34			2048	2.25	2160	2.10
35			2049	2.24	2165	2.10

2.2.3. Mortality Assumptions

Life tables were developed to establish the set-up of initial level and composition of mortality by males and females. The life table output, i.e. life expectancies at birth (e_0), was used to compute the person years lived between ages x and $x+n$ (nL_x) for the different projection cycles. The construction of life tables is described in the Analytical Report on Mortality and Health. For Kenya, the 2019 life expectancy at birth for males was 60.6 years while that for females was 66.5 years.

The projection of the mortality levels was done after generating a reliable and plausible life table. Life expectancies at birth for both males and females were generated using the PASEX E0LGST application. The projection was done using a logistic function with a lower asymptote of 30 years for both males and females, and an upper asymptote of 70 years for males and 75 years for females. These estimates were also considered in part that mortality had declined in Kenya in the past decade owing to the many interventions that had been put in place.

The interpolated and extrapolated life expectancy values at births calculated using a logistic trend, shown in Table 2.2 were used to compute nL_x values used in population projections. A similar approach was used to project mortality at the county level.

Table 2.2: Projected Life Expectancy at Birth, 2020 - 2100

Year	Male	Female	Year	Male	Female
2020	62.50	67.16	2045	67.21	71.46
2021	62.77	67.39	2050	67.74	72.01
2022	63.03	67.62	2055	68.17	72.48
2023	63.29	67.84	2060	68.53	72.87
2024	63.53	68.05	2065	68.81	73.21
2025	63.77	68.26	2070	69.05	73.50
2026	64.01	68.47	2075	69.23	73.74
2027	64.23	68.67	2080	69.39	73.94
2028	64.45	68.86	2085	69.51	74.11
2029	64.66	69.05	2090	69.61	74.26
2030	64.86	69.24	2095	69.68	74.38
2035	65.79	70.09	2100	69.75	74.48
2040	66.56	70.82			
Asymptotes	Male	Female			
Lower	30.00	30.00			
Upper	70.00	75.00			

2.2.4. Migration

Along with births and deaths, migration is one of the three demographic components of population change, and has often been described as the most difficult to measure, model and forecast. Unlike fertility and mortality, migration is not a single unique event in time and space, but can repeat itself over the lifetime of an individual.

Migration is not the outcome of a single factor but of complex configurations of multiple, interdependent and interacting factors. Migration drivers shape parameters and contexts within which people decide whether or not to move. They increase or decrease the salience of migration, the likelihood of certain migration routes, and the attractiveness of different locations. Drivers influence decisions to migrate, whether the migration is internal or international, regular or irregular, and/or temporary or permanent; and they operate along a spectrum between voluntary and involuntary movement (IOM Glossary, 2019). Further, migration drivers are not static but may change dynamically which makes migration regulations and practices not only difficult to foresee, but also to predict (UN DESA, 2013).

International migration

International migration is the movement of people across national borders. According to the 2019 Kenya population census, international migrants accounted for less than one percent of the resident population

in Kenya; an indication that international migration has negligible impact on population change in the country and, therefore, the assumption of negligible net international migration was used for the projections.

Internal migration

In the 2019 Kenya population census, internal migration was measured using the question on place of usual residence 12 months prior to the census night. The number of in-migrants and out-migrants during the period was tabulated by age and sex. Derived average recent net migration rates were used in the population projection exercise. Extrapolation was done to move the data from 1 year to 5 years. At the national level, net migration was zero, as it assumed that migration inflows and outflows cancel each other. Net migration rates for counties were adjusted to ensure that the sum of all county net internal flows by age and sex was zero or negligible. The average net migration figures in the last four censuses (1989, 1999, 2009 and 2019) were used to represent internal migration at the county level. It was assumed that the average net migration rates would remain constant during the projection period.

2.2.5. Base Population

An initial examination of the population showed that there was an undercount of the 0-9 population. The recommended adjustment was done using a procedure that involves estimating the number of children born to survivors of mothers using information on fertility and mortality from the 2009 and 2019 population and housing censuses. The estimates used the lifetable nL_x values from the two censuses for males and females. Similarly, age-specific fertility rates (ASFRs) were obtained from the 2009 and 2019 population censuses. These were interpolated to produce estimates for 2.5 and 7.5 years before the 2019 census. The smoothed populations were then used as inputs. The resulting national and county base populations are presented in Appendix 4.

2.2.6. Smoothing of the Population

Each specific population under age 5 and the population ages 5 to 9 were adjusted upward to be consistent with fertility and mortality. Populations age 10 and above were evaluated for possible age heaping and, when found, smoothed using the Arriaga's "strong" smoothing technique. The assessment of age and sex data report used light smoothing. Care was taken not to smooth out distortions in the age structure possibly attributable to in- or out-migration.

Chapter 3: Population Projections

3.1. Introduction

Component projection for a national population closed to migration begins by projecting an *initial* distribution of population by age and sex in n year age groups forward n years to give a *projected* age-sex distribution, n denoting the width of the closed age groups. This process is repeated beginning with the 1st projected age-sex distribution to give a second projected age-sex distribution, and so on for as many projection cycles as desired.

Each projection cycle corresponds to an n -year time period. The initial and projected age-sex distributions refer, respectively, to the beginning and end of this period. The fertility and mortality parameters and numbers of births and deaths refer to this time period. Depending on the assumptions used, values of the fertility and mortality parameters may change from one projection cycle to the next.

Projections are generally carried out for age distributions in single years ($n = 1$) or $n=5$ year age groups. The value of n dictates the future times for which projected age-sex distributions are provided. Single-year age groups give projected age-sex distributions at single year time intervals, while five-year age groups result in projections at 5-year intervals.

The quality of the age distributions (which reflects age-selective omission as well as age misreporting) dictates calculations using 5-year age groups and so gives projected age distributions at 5-year intervals. Five-year age-sex distributions at single year time intervals may be interpolated.

3.2. Population Growth

Kenya's annual population growth is expected to continue declining over the projection period. The annual growth rate is expected to decline from 1.8 percent in 2020 (with a population of 48.8 million) to 1.2 percent in 2045 (with an expected population of 70.2 million). The absolute annual change in population is expected to continue increasing until 2035 and thereafter start declining. Correspondingly, the annual number of births in 2035 is expected to be 1.29 million and 1.28 million in 2045 (Refer to Appendix 5 part b).

3.3. National Projections

The national projection results under the above set of assumptions are shown in Table 3.1 and Figure 3.1. Starting with a population of 48.8 million in 2020, it is projected that the population will reach 53.3 million by 2025, 57.8 million by 2030, 62.2 million by 2035, and 70.2 million by 2045. Detailed population projections by age and sex are provided in Appendix 5.

Table 3.1: Projected Population, Kenya, 2020-2045

Year	Male	Female	Number in thousands
			Total
2020	24,214	24,604	48,818
2021	24,659	25,061	49,720
2022	25,104	25,519	50,623
2023	25,549	25,976	51,526
2024	25,994	26,434	52,428
2025	26,440	26,891	53,331
2030	28,666	29,145	57,811
2035	30,842	31,322	62,165
2040	32,913	33,393	66,307
2045	34,846	35,334	70,180

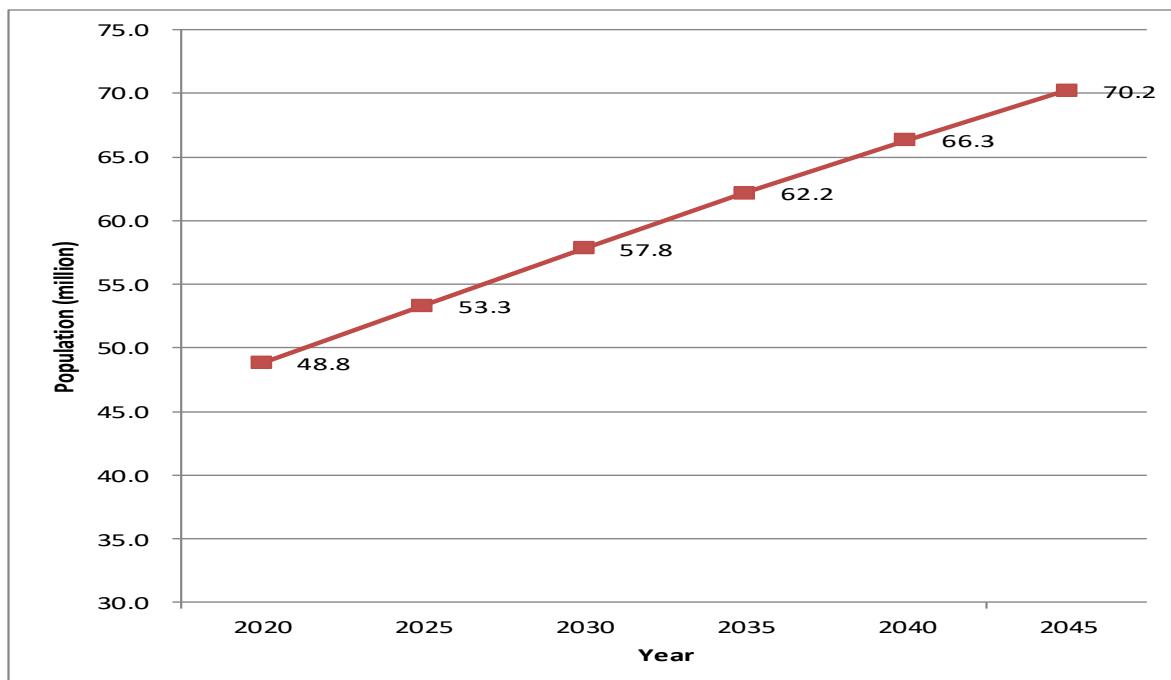

Figure 3.1: Projected Population, Kenya, 2020-2045

3.4. County Projections

The county population projections may not be perfectly consistent with the national projections -even if all county areas are closed to migration, i.e. the sum of the projected age-sex distributions for the county populations, for example, will not be equal to the projected national age-sex distributions. The same is true of projected components of growth, births, deaths, and net internal migrants. For internal migrants, inconsistency may manifest as the number of net migrants within counties may not sum to zero.

To address the inconsistency, there is need to adjust the county projections to make them consistent with the national projection. A side effect of this adjustment is a set of parameters that provide information on the degree of consistency between the stipulated national and county fertility, mortality, and migration

parameters. Perfect consistency of the fertility and mortality parameters will result in adjustment parameters identically equal to 1. Perfect consistency of the county migration parameters will result in adjustment parameters identically equal to 0. The level of inconsistency is accordingly indicated by the extent to which the fertility, mortality, and internal migration adjustment parameters differ from 1 (fertility and mortality) or 0 (internal migration). Detailed methodology is provided in Appendix 2.

Table 3.2 presents the county population projections from 2020 to 2045. Appendix 5 presents detailed projections by age, sex and county. The projected populations of all counties are expected to continue increasing throughout the projection period. Counties expected to experience the highest percentage of population during the projection period are Samburu (84%), Tana River (81%), Narok (79%), Lamu (77%), Wajir and Turkana (75%) each.

In terms of numbers, Nairobi City, Kiambu, Nakuru, Narok and Kakamega counties are expected to have the highest increase. Counties expected to have the lowest population increase are Nyamira (12%), Vihiga (17%), Kisii (18%), Kirinyaga (19%) and Machakos (20%). This may be explained largely from the fact that these counties are net losers in terms of migrants.

Table 3.2: County Population Projections, 2020-2045

County	2020	2021	2022	2023	2024	2025	2030	Number in thousands

3.4.1. Counties with the Highest Population Increase

The expected rate of increase in the projected populations between 2020 and 2045 will vary by county. Nairobi City is expected to continue to be the most populous throughout the projection period. The other most populous counties whose ranks population are expected to remain within the next 20 years are Kiambu, Nakuru, Kakamega and Bungoma. Counties whose ranks are expected to improve include Kilifi,

Narok and Migori. Table 3.3 provides the rankings of the counties that are expected to experience the highest population increase by 2045.

Table 3.3: Counties expected to experience the highest population increase by 2045

Rank	Base Population		Projected Population		Number in thousands
	County	2020	County	2045	
1	Nairobi	4,516	Nairobi	6,180	
2	Kiambu	2,501	Kiambu	3,717	
3	Nakuru	2,202	Nakuru	3,372	
4	Kakamega	1,897	Kakamega	2,654	
5	Bungoma	1,700	Bungoma	2,265	
6	Meru	1,565	Kilifi	2,214

Chapter 4: Sectoral Population Projections

4.1. Introduction

To ease planning processes, it becomes necessary to project some special population groups. Projections of school-going population, labour force population and households are included in this analytical report. Table 4.1 shows projection for special population. The population projection include the projection of the infants, under five, youth and the older persons.

Table 4. 1: Special Population Projections

Kenya Age	2020			2025			2030			2035

4.2. School Going Population Projections

School-going population projections corresponded to both the Competency Based Curriculum (CBC) and 8-4-4 educational systems. The population for CBC education system: pre-school - population age 4-5 years; lower primary - population age 6-11 years; junior secondary - population age 12-14 years; and senior secondary population age 15-17 years. The population for the 8-4-4 educational system: pre-school - population age 3-5 years; primary - population age 6-13 years; and secondary - population age 14-17 years. The projected school-going population at national and county levels are as depicted in Table 4.2 and Appendix 6 respectively.

Table 4.2: Projected School-Going Population, 2020-2030

Nationally, children of pre-school age (4-5 years) are expected to increase by 2.8 percent, from 2.46 million in 2020 to 2.53 million in 2030. Those of primary school age (6-11 years) under CBC are expected to increase by 4.4 percent from 7.17 million in 2020 to 7.49 million in 2030; those of lower secondary school (age 12-14) under CBC are expected to increase by 6.5 percent from 3.44 million in 2020 to 3.67 million by 2030. Pupils of senior secondary school (age 15-17) under CBC are expected to increase by 8.4 percent over the next 10 years; those age 3-5 are expected to increase by 2.6 percent; those age 6-13 are expected to increase by 4.9 percent; while those age 14-17 are expected to increase by 8.1 percent. At county level, the rate of increase in the projected school-age population is expected to vary. Details of the projected school-age populations by sex and county are shown in Appendix 6.

4.3. Labour Force Base Population Projections

The population in the labour force (those aged 15-64 years) was projected as shown in Table 4.3. Nationally, the population in the labour force is expected to increase by 40.7 percent from 28.8 million in 2020 to 40.5 million by 2035.

Table 4. 3: Projected Labour Force Base Population by County, 2020-2035

		2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035

4.4. Household Projections, 2020-2030

Introduction

Estimates of the number of households in future are of great importance to planners and policy analysts in governmental, business, nonprofit, and academic organizations since the household is the unit of consumption of durable goods. For example, the household serves as a basic unit of housing demand since it is a unit of common dwelling. Additionally, a number of indicators for monitoring and evaluation of the achievement of the Kenya Vision 2030 and the SDGs, particularly at county level, are dependent on knowing the total number of households.

Projection methodology

Several methods of household projections exist, the simplest being the use of headship rates and its extensions. This is the projection of percent distribution of population by sex, age and marital status, and of headship rates. It is an extrapolation method outlined in the UN Manual VII (UN, 1973). Extensions include the use of the modified exponential given by:

$$h^s(m, x, t+k) = 1 - [1 - h^s(m, x, t-n)] \times \left[\frac{1 - h^s(m, x, t)}{1 - h^s(m, x, t-n)} \right]^{\frac{(t+k)-(t-n)}{n}}$$

or

$$h^s(m, x, t+k) = h^s(m, x, t-n) \times \left[\frac{h^s(m, x, t)}{h^s(m, x, t-n)} \right]^{\frac{(t+k)-(t-n)}{n}} \quad -----$$

Where,

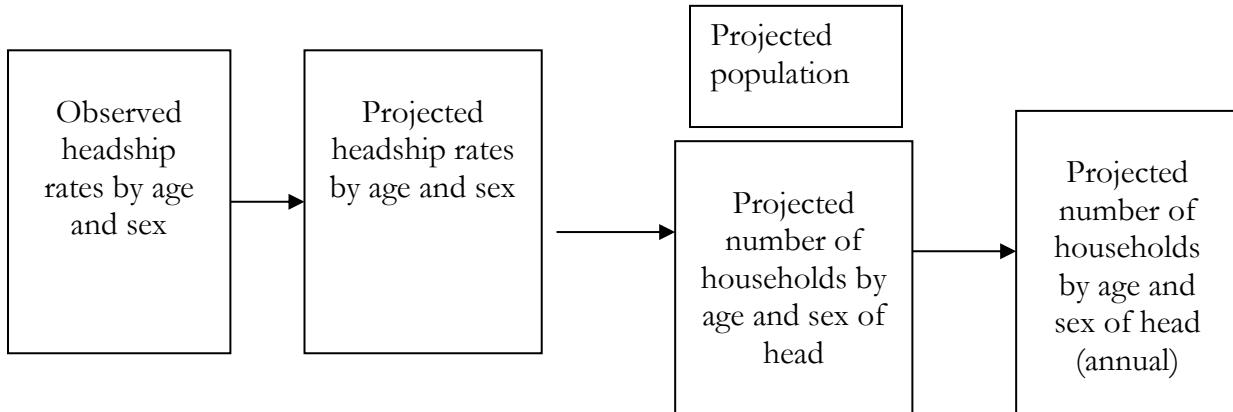

$h^s(m, x, t)$ indicates headship rate specific for sex s , marital status m , age x and year t ,

$h^s(m, x, t+k)$ denotes headship rate specific for sex s , marital status m , age x and year $t+k$, and

$h^s(m, x, t-n)$ is headship rate specific for sex s , marital status m , age x and year $t-n$.

n in this equation marks the base period between two census years.

For the sake of simplicity, marital status will be omitted and the simple framework is as follows;

Projected Number of Households

Table 4.4 shows the projected number of households at national and county levels. It shows that by 2030, there will be approximately 15.9 million households. Nairobi City, which is entirely urban, will require nearly 2 million houses to host its population by 2030.

Table 4.4: Projected Number of Households by County, 2020-2030

County	Projected

Chapter 5: Summary, Conclusion and Recommendations

5.1. Introduction

This volume summarizes population projections for Kenya based on the 2019 Kenya Population and Housing Census. Population projections give an indication of what the future population would be if certain likely rates of fertility, mortality and migration were to apply. The projected size, composition, and distribution of the population at different geographic units and points in time form a rational basis to gauge the primary needs of the Kenyan population.

This report outlines the assumptions and methods on which the projections were based. Considerable effort was devoted to providing full documentation of the methods used. Highlights of the projection results are presented in the chapters at national and county levels. Detailed projection results are presented in Appendix 5.

This conclusion discusses issues encountered in generating the projections and also highlights key recommendations that may be relevant to future Kenyan censuses.

5.2. Summary and Conclusions

Methodology

The cohort component method was used to project both the national and county populations. The requisite input information about the components of population change (fertility, mortality and migration) were taken into account in the projection of both the national and county populations.

2019 KPHC Data Quality Issues

There was a possible under-coverage of births in the last 12 months before the census by as much as 8.5 per cent. In Marsabit, there was a suspected over-reporting of male births as opposed to female births, giving a high sex ratio at birth similar to countries where sex-selective abortions occur. In Mandera, there was a possible under-reporting of female births.

Deaths in age 5-65 that had occurred in the households before the census was under-reported and this was more severe for females. Coverage of male deaths was just about 61 per cent while that for female deaths was about 39 per cent if data is considered from age 5 to 65. When the age range was narrowed from 30 to 60, coverage for male deaths was slightly lower at 59 per cent while that for female deaths remained the same.

There was improved age reporting but with wide differentials by place of residence and county. There was better reporting of age in rural areas compared to urban areas according to the UN accuracy index. Garissa,

Wajir, Mandera, Isiolo, and Marsabit had the lowest accuracy on age reporting. In these counties, male adults age 60 and above were over-reported.

Fertility Projections

At both national and county levels, it was assumed that TFR would continue to decrease till the end of the projection period. For example, the TFR was assumed to decline from 3.4 in 2040 to 2.1 in 2050. Similar fertility assumptions were made for each county using national and county estimates of TFR from the 2019 census as inputs.

Mortality Projections

Mortality projections were based on projecting future expectation of life at birth for males and females, defined as the expected average lifespan of a child born today if current age-specific mortality levels were held fixed in the future. Expectation of life at birth was assumed to increase from 58.5 for males and 61.6 for females in 2020 to 65.3 and 69.5 in 2040 respectively. This was based on the fact that both the 2014 KDHS and the 2019 Census had shown improvement in infant and child mortality.

Migration Projections

Like in previous censuses, Kenya continues to record very low volumes of international migration (less than 1%) – hence an insignificant factor in population change; and therefore, not incorporated into the national population projections.

Internal migration was measured using responses to the question on place of residence 12 months prior to the census night. The number of in-migrants and out-migrants during the period was tabulated for each county by age group and sex. Net migration rates were calculated, and used as the input for the initial projection year. The average net migration figures in the last four censuses (1989, 1999, 2009 and 2019) were used to represent internal migration at the county level. It was assumed that these averages would remain constant for the entire projection period.

National Population Projections

The projection results indicate that the national population is expected to increase from 48.4 million in 2020 to 52.9 million in 2025, 57.6 million in 2030, 62.4 million in 2035, 67.1 million in 2040 and 70.2 million in 2045.

County Population Projections

The population in all counties is projected to grow, and that none of them is expected to experience population decline at any point. Counties expected to experience highest percentage of population

increase during the projections period are Kajiado, Lamu, Samburu, Narok, Tana River, Kiambu and Mombasa.

In terms of numbers, Nairobi City, Kiambu, Nakuru, Kajiado and Mombasa are expected to have the highest increase. Counties expected to experience the lowest population increase are Makueni , Vihiga, Kisii, Kitui and Murang'a. This may be explained largely from the fact that these counties are net losers in terms of migrants.

Recommendations

Based on the experiences of projecting the population at different levels and through the twenty-five-year span, a few recommendations have emerged as articulated below.

- Quality of census data remains a key area of focus in future censuses. It is recommended that all critical aspects be addressed at different stages of census management: design of questionnaire (maintain the bare minimal of questions); publicity (pointing out various data quality issues, especially those associated to specific regions); training (as a useful forum to improve data quality); field coordination (for quality assurance).
- Much as international migration was insignificant in projecting population at national level, the volume and rate of immigration were not clearly established. As well, projecting urban population was hampered due to lack of data on rural-urban migration. Consequently, it is recommended that the questionnaire should clearly capture issues on rural-urban migration and also Kenyans in the diaspora.
- With increasing demand for accurate population projections at the county level, population census may not be the most appropriate option as a source for such data – hence the need to explore other viable options. In this regard, it is recommended that counties be advised to invest in improving systems that will serve as sources of relevant data to their needs. These will include baseline surveys, vital registration systems, etc.
- All over the world, it is generally agreed that population projections should always be treated as provisional – given that the assumptions used might not materialize throughout the projection period. It is, therefore, recommended that regular review of the projections be undertaken when new data becomes available.

Appendix 2: Population Projections Methodology

The 2019 Kenya Population Projections used the cohort component method. The cohort-component method is by far the most popular population projection method. It is used for national and county population projections. The cohort-component method is based upon the balance equation extended for age and sex and is therefore internally consistent. Because it is based on age-structured populations and events (births, deaths, migration), it yields a rich set of demographic indicators.

The projections presented in this report are produced using the methodology described in (Feeney, 2017), a top-down, net migration rates approach that begins with a national projection and produces county projections consistent with this national projection. In brief overview, it involves three steps.

Step 1 Produce a national population projection based on the stipulated national fertility and mortality parameters. This methodology has been standard for over half a century and is described in Chapter 6 of Preston, Heuveline, and Guillot (2001).

Step 2 Produce county projections based on the stipulated county fertility, mortality, and migration parameters. Projected numbers of survivors of persons in county area are calculated in the same way as projected national numbers. Net numbers of age-sex-specific internal migrants for each county area were calculated using net migration “rates”, the quotes signaling that these parameters are not demographic rates in the usual sense of the word (Feeney; 2017 - section 4).

In the nature of the situation, the county projections will not be perfectly consistent with the national projections—even if all county areas are closed to migration. The sum of the projected age-sex distributions for the county populations, for example, will not be equal to the projected national age-sex distributions. The same is true of projected components of growth, births, deaths, and net internal migrants. For internal migrants, inconsistency manifests as numbers of net migrants for county that do not sum to zero.

Step 3 Adjust the county population projections to make them consistent with the national projection. A side effect of this adjustment is a set of parameters that provide information on the degree of consistency between the stipulated national and county fertility, mortality, and migration parameters. Perfect consistency of the fertility and mortality parameters will result in adjustment parameters identically equal to 1. Perfect consistency of the county migration parameters will result in adjustment parameters identically equal to 0. The level of inconsistency was accordingly indicated by the extent to which the fertility, mortality, and internal migration adjustment parameters differed from 1 (fertility and mortality) or 0 (internal migration).

Component projection for a national population closed to migration begins by projecting an initial distribution of population by age and sex in n year age groups forward n years to give a final projected age-

sex distribution, n denoting the width of the closed age groups. This process is repeated beginning with the 1st projected age-sex distribution to give a 2nd projected age-sex distribution, and so on for as many projection cycles as desired.

Each projection cycle corresponds to an n -year time period. The initial and projected age-sex distributions refer, respectively, to the beginning and end of this period. The fertility and mortality parameters and numbers of births and deaths refer to this time period. The values of the fertility and mortality parameters may change from one projection cycle to the next.

Projections are generally carried out for age distributions in single years ($n = 1$) or $n = 5$ year age groups. The value of n dictates the future times for which projected age-sex distributions are provided. Single year age groups give projected age-sex distributions at single year time intervals while five year age groups result in projections at 5 year intervals.

The quality of the age distributions (which reflects age-selective omission as well as age misreporting (United Nations Statistics Division, 2001, paragraphs 407-419)), dictates calculations using 5 year age groups and so gives projected age distributions at 5 year intervals. Five year age-sex distributions at single year time intervals may be interpolated. Interpolation to single year age distributions is possible, but is problematic and beyond the scope of this report.

Step 2: Calculation of Initial County Projections

The county projection methodology requires more information about projection cycles than is needed for the national projection. Table 6.1 shows inputs and outputs for a single cycle of component projection for a county organized into what was referred to as a projection frame.

Female and male numbers are “stacked” female over male with row labels that indicate sex by a leading “f” or “m”. The left most column contains the input sex-age distribution for the cycle, the rightmost column the output sex-age distribution for the projection period.

The intervening columns show the mortality, fertility, and internal migration parameters for the cycle (nLx , ASBR, and NIMR) and the numbers of deaths, births, and net internal migrants calculated from these parameters.

Rows are provided for sex-age groups, but also for female and male births during the projection period, deaths of these births, and for female and male column totals. The open-ended age group for the life table nLx values must be n years older than the open-ended group for the sex-age distributions, requiring additional rows for the female and male nLx open-ended age groups.

A projection, whether for the national or a county, consists of a sequence of projection frames, one for each projection cycle. It is convenient to calculate projections by first initializing the projection frames for each projection cycle and then calculating the projection.

Initialization consists of entering the mortality, fertility, and net internal migration parameters in the nL_x , SRB-ASBR, and NIMR columns of all projection frames and entering the initial sex-age distribution in the ASDin column of the first projection frame.

Calculation involves computing the number of deaths, births, net internal migrants survivors of the initial population at the end of the period, and projected age-sex distribution, entering these numbers in the appropriate positions in the frame, copying the output sex-age distribution for the 1st projection frame to the input sex-age distribution of the 2nd projection frame, repeating the calculations made for the first frame, and so on.

A set of county population projections is consistent with a national population projection if the following statements are true of the county and national projection frames for all projection cycles.

1. The sum of the number of deaths in each age-sex group over all county projection frames is equal to the number in the same age-sex group in the national projection frame
2. The sum of the number of births in each reproductive age group, and of the total numbers of female and male births, over all county population projection frames are equal to the corresponding number in the national population projection frame; and
3. The sum of the number of net internal migrants in each sex-age group over all county population projection frames is equal to zero

Step 3: Calculation of Final County Projections

Begin by initializing projection frames for the national and county projections and calculate the national projection. Execute the next steps for the 1st, 2nd, etc projection cycles to produce county projection frames for each cycle that are consistent with the national projection frame for this cycle.

3.1(a) Calculate Deaths to the Initial Population: Use the life table nL_x values in the projection frame for each county population to calculate the number of deaths to women aged 0-4, 5-9, ..., 90-94, 95+ during the projection period. Enter these numbers in the corresponding rows of the Deaths column of the projection frame for this county population. Repeat for males.

3.1(b) Adjust Deaths to the Initial Populations: For each age-sex group, sum the number of deaths over all county population projection frames. Compare this sum to the number of deaths for the same age group in the national population frame. Calculate an adjustment factor

that, when applied to the initially calculated numbers of deaths, gives adjusted numbers of deaths that sum exactly to the number for the national population. This is *constant factor adjustment*. Overwrite the initial numbers of deaths in each county projection frame by the adjusted numbers of deaths.

3.2 Calculate Survivors of the Initial Population: Using the initial population numbers and the adjusted numbers of deaths in each subnational projection frame, calculate the numbers of survivors in each age-sex group at the end of the projection period. Enter these numbers in the appropriate row of the Survivors column of the subnational projection frames. The consistency of the numbers of deaths implies the consistency of the numbers of survivors.

3.3 (a) Calculate Births to Women in Reproductive Age Groups: Use the age-specific birth rates in each county projection frame to calculate the total number of births to women in each reproductive age group. The birth rates are applied to the numbers of person years lived during the projection period calculated from the ASDin and Survivors columns. Enter these numbers of births in the appropriate rows in the Births column of this county projection frame.

3.3 (b) Adjust Births to Women in Reproductive Age Groups: Apply the constant factor adjustment to produce adjusted numbers of births for each county population projection frame that are consistent with the corresponding numbers of births in the national projection frame. Overwrite the initial numbers of births by the adjusted numbers.

3.4 (a) Calculate Total Female Births/Total Male Births: Use the sex ratio at birth and the total number of births in each county projection frame to calculate total female births and total male births. Enter these total numbers in the fBirths and mBirths rows of the ASDin column of the county projection frame.

3.4 (b) Adjust Total Female Births/Total Male Births: Use the constant factor adjustment to produce adjusted total female births in the county projection frames that are consistent with total female births in the national projection frame. Repeat for males. Overwrite the initial numbers by the adjusted numbers.

3.5 (a) Calculate Deaths of Female/Male Children Born during the Projection Period: Use the life table radix and female nL_0 values in each county projection frame to calculate the number of deaths of female births during the projection period. Repeat for males. Enter these numbers of deaths in the fBirths and mBirths rows of the Deaths column of each county projection frame.

3.5 (b) Adjust Deaths of Female/Male Children Born during the Projection Period: Use constant factor adjustment to produce adjusted deaths of female births in each county projection

frame that are consistent with deaths of female births in the national projection frame. Repeat for males. Overwrite the initial numbers by the adjusted numbers.

3.6 Calculate projected number of Females/Males in the 0-4 Age Group: Using the adjusted number of female births during the projection period and the adjusted number of deaths of these births in each county projection frame, calculate the number of survivors of these births at the end of the projection period, which is the projected number of females aged 0-4 years. Repeat for males. The consistency of the numbers of female/male births and of deaths of these female/male births implies the consistency of the 0-4 numbers.

The Survivors Column of County Projection Frames: The Survivors column of a projection frame for a county shows numbers of survivors at the end of the projection period of persons who were in this county at the beginning of the period. Not all of these survivors will still be in the county at the end of the period: they may have migrated to a different county during the projection period. Likewise, some survivors at the end of the projection period of persons who were in a different county at the beginning of the period may have migrated into this county during the projection period. The net number of migrants in each age-sex group for a county is equal to the number of in-migrants minus the number of out-migrants for this age-sex group.

3.7 (a) Calculate Net Internal Migrants: Apply the net internal migration “rates” in the NIMR projection frame for each county to the numbers of survivors in the Survivors column to calculate the corresponding numbers of net internal migrants. Enter these numbers in the NIM column of the projection frame.

3.7(b) Adjust Net Internal Migrants: This adjustment is slightly more complicated than the constant factor adjustment used for births and deaths. It is described in detail in Feeney (2017, Section 6). The idea is to separate, for each age-sex group, the net migration numbers for all counties into two groups; those that are positive, and those that are negative, and calculate the sum of the numbers in these two groups. The first sum will be positive, the second negative. The net migration numbers are consistent if these two sums is zero. This will be true if, and only if, the first sum is equal to the absolute value (the number without the sign) of the second group. If this is not the case, suppose that the sum of the positive numbers is greater than the absolute value of the sum of the negative numbers, the idea will be to adjust each positive net migration number down by multiplying it by $1-x$ and adjust each negative net migration number up by multiplying it by $1+x$, choosing x so that the sum of the net migration numbers over all counties is zero.

Appendix 7: Contributors to the 2019 Kenya Population and Housing Census Monographs

Name and Institution	Role
Mr. Macdonald Obudho, MBS Director General, Kenya National Bureau of Statistics	National Census Coordinator
Mr. Abdulkadir Amin Awes, Kenya National Bureau of Statistics	Deputy National Census Coordinator
Mr. Collins Omondi, OGW Kenya National Bureau of Statistics	Technical Coordinator
Mr. Benjamin Avusevwa Kenya National Bureau of Statistics	Technical Coordinator
Mr. Robert Nderitu, OGW Kenya National Bureau of Statistics	Technical Coordinator
Ms. Anne M. Mburu, HSC Kenya National Bureau of Statistics	Technical Coordinator
Mr. Samuel Ogola Kenya National Bureau of Statistics	Technical Coordinator
Prof. Alfred Agwanda, MBS University of Nairobi	Lead Author - all Monographs
Mr. Ben O. Jarabi University of Nairobi	Lead Author - all Monographs
Mr. James Ng'ang'a, HSC Kenya National Bureau of Statistics	Census Project Manager/ Author, Urbanization
Ms. Vivianne Nyarunda, HSC Kenya National Bureau of Statistics	Author, Labour Force /Gender Dimensions
Mr. Elias Nyaga Kenya National Bureau of Statistics	Author, Older & Vulnerable Populations/Population Projections
Mr. Michael Musyoka, HSC Kenya National Bureau of Statistics	Author, Fertility/ Gender Dimensions/ Population Dynamics/Population Projections
Mr. John Makau Kenya National Bureau of Statistics	Author, Migration/Population Dynamics/Population Projections
Mr. Paul Waweru, HSC Kenya National Bureau of Statistics	Author, Fertility/ Population Projections/ Data Processing/ Formatting
Ms. Priscilla Ndayara Kenya National Bureau of Statistics	Author, Migration

Mr. Andrew A. Imbwaga, HSC Kenya National Bureau of Statistics	Author, Mortality and Health /Population Dynamics/ Gender Dimensions/ Population Projections
Ms. Schola Kingi Kenya National Bureau of Statistics	Author, Mortality and Health/ Gender Dimensions/ Population Dynamics/ Population Projections
Ms. Leah Wambugu Kenya National Bureau of Statistics	Author, Mortality and Health
Mr. James Munguti Kenya National Bureau of Statistics	Author, Household and Family Dynamics
Ms. Rosemary Kong'ani Kenya National Bureau of Statistics	Author, Older and Vulnerable Population
Ms. Caroline Gatwiri Kenya National Bureau of Statistics	Author, Gender Dimensions/Household and Family Dynamics/ Population Dynamics/ Population Projections
Mr. Francis Kundu National Council for Population and Development	Author, Older and Vulnerable Population
Mrs. Judy Kilobi Otieno Civil Registration Services	Author, Youth and Adolescents
Dr. Andrew Mutuku University of Nairobi	Author, Youth and Adolescents / Reviewer; Population Dynamics, Households & Family Dynamics
Mr. Lewis Ngari Kenya National Bureau of Statistics	Author, Youth and Adolescents / Gender Dimensions
Mr. Godfrey Otieno Kenya National Bureau of Statistics	Author, Education and Training/ Gender Dimensions/ Population Dynamics/ Population Projections/ Disability
Mr. Peter Wanjohi Kenya National Bureau of Statistics	Author, Education and Training/ Labour Force
Mr. Robert Buluma Kenya National Bureau of Statistics	Author, Disability/ Gender Dimensions
Mr. Stanley Wambua Kenya National Bureau of Statistics	Author, Disability/ Gender Dimensions
Ms. Renice Bunde Kenya National Bureau of Statistics	Author, Disability/ Gender Dimensions/ Population Dynamics/ Population Projections
Ms. Winnie Kemunto Kenya National Bureau of Statistics	Author, Disability
Mr. John Mburu Kenya National Bureau of Statistics	Author, Agriculture

Mr. Joseph Kibor State Department for Livestock Development	Author, Agriculture
Mr. Rogers Mumo Kenya National Bureau of Statistics	Author, Agriculture/ Formatting
Mr. Alphonse Orang'o Kenya National Bureau of Statistics	Author, Agriculture
Mr. Jim Kirimi Kenya National Bureau of Statistics	Author, Housing Conditions, Amenities and Household Assets/ Population Projections
Ms. Tabitha Wambui Kenya National Bureau of Statistics	Author, Housing Conditions, Amenities and Household Assets
Mr. Paul K. Samoei Kenya National Bureau of Statistics	Author, Housing Conditions, Amenities and Household Assets
Ms. Linah Ngumba Kenya National Bureau of Statistics	Author, ICT/ Gender Dimensions
Mrs. Rosemary Bowen Kenya National Bureau of Statistics	Author, ICT
Mr. Kenneth Malakwen Communications Authority of Kenya	Author, ICT
Dr. George Odipo University of Nairobi	Author, Migration
Dr. Samuel Wakibi University of Nairobi	Author, Older and Vulnerable Population
Prof. Sam Owuor University of Nairobi	Author, Urbanization
Dr. Isaiah Bwila, OGW Ministry of Interior & Coordination of National Government	Author, Older and Vulnerable Population
Prof. George Orwa Bomet University College	Author, Education and Training
Dr. Caroline Odhiambo	Author, Education and Training
Dr. Francis Kiarie JKUAT University	Author, Education and Training
Prof. Owiti Kakumu University of Nairobi	Author, Housing Conditions, Amenities and Household Assets

Prof. Antony Waititu JKUAT University	Author, Disability
Ms. Verity Mganga State Department for Gender	Author, Gender Dimensions
Mr. Caneble Oganga UN Women/KNBS	Author, Gender Dimensions/ Data Processing
Ms. Maureen Gitonga UN Women	Author, Gender Dimensions
Ms. Dinah Mutinda UNFPA	Author, Gender Dimensions
Ms Tabitha Weru Kenya National Bureau of Statistics	Author, Agriculture
Ms Monicah Karanja Kenya National Bureau of Statistics	Author, Agriculture
Mr. Tom Dienya State Department for Agriculture	Author, Agriculture
Ms. Jane Kioko State Department for Agriculture	Author, Agriculture
Ms Jane Njeru State Department for Agriculture	Author, Agriculture
Mr. Stephen Ndegwa Fisheries Authority and the Blue Economy	Author, Agriculture
Mr Alex Lukwenda State Department for Fisheries	Author, Agriculture
Dr. Anne Khasakhala University of Nairobi	Peer Reviewer, Adolescents & Youth/Gender Dimensions
Prof. Kimani Murungaru University of Nairobi	Peer Reviewer/Fertility & Nuptiality
Prof. Lawrence Ikamari University of Nairobi	Peer Reviewer/Mortality & Health
Dr. Daniel Mutegi State Department for Housing and Urban Development	Peer Reviewer/Urbanization
Mr. Sebastian Owanga University of Nairobi	Peer Reviewer/Education

Dr. Edwin Oyaro Ondieki University of Nairobi	Peer Reviewer/Housing Conditions, Amenities and Household Assets
Mr. Peter Musakhi Ministry of Devolution and ASAL	Peer Reviewer/Disability
Dr. Wanjiru Gichuhi University of Nairobi	Peer Reviewer/Older & Vulnerable Population
Dr. Owen Nyang'oro University of Nairobi	Peer Reviewer/ICT
Ms. Mary Muyonga University of Nairobi	Peer Reviewer/Migration
Mr. Peter Nyakwara National Council for Population and Development	Peer Reviewer/Migration
Dr. Owuor Olunga University of Nairobi	Peer Reviewer, Gender Dimensions
Dr. Jacob Omolo Kenyatta University	Peer Reviewer, Labour Force
Dr. Jonathan Nzuma University of Nairobi	Peer Reviewer, Agriculture
Ms. Katunge Kiulu Kenya National Bureau of Statistics	Overall Editor
Dr. Dennis Shilabukha University of Nairobi	Editor, Gender Dimensions
Mr. Paul Kuria National Gender and Equality Commission	Editor, Gender Dimensions
Mr. Mutua Kakinyi Kenya National Bureau of Statistics	Data Processing
Mr. Job Mose Kenya National Bureau of Statistics	Data Processing/ Author, Education and Training/Population Projections/Population Dynamics/Gender Dimensions
Mr. Benson Karugu Kenya National Bureau of Statistics	Data Processing/ Labour Force
Mr. Njoroge Nyoike Kenya National Bureau of Statistics	Author, Labour Force
Mr. Newton Amugune Kenya National Bureau of Statistics	Author, Labour Force

Mr. Peter Nyariwo Ministry of Labour and Social Protection	Author, Labour Force
